

CLAIMS

1. Process for the production of a fiber-based armature particularly adapted to be embedded in a matrix or a mixture of
5 matrices, characterized in that it consists in performing the following steps:

- preparing a fiber-based material, and
- depositing on at least one of the surfaces of the material thus obtained, a repositionable glue.

10

2. Process for the production of a fiber-based armature according to claim 1, characterized in that it comprises a supplemental step which consists in emplacing a removable separator on the surface having received said layer of
15 repositionable glue.

3. Process for the production of a fiber-based armature according to claim 1 or 2, characterized in that it comprises a step of cutting off in sheets or rolling up.

20

4. Process for the production of a fiber-based armature according to claim 1 or 2, characterized in that it consists in selecting the repositionable glue by adjusting its mechanical properties such that it will be compatible with the matrix used
25 without giving rise to pollution.

5. Process for the production of a fiber-based armature according to any one of the preceding claims, characterized in that the repositionable glue is applied at the outlet of
30 production of the reinforcement, by spraying.

6. Process for the production of a fiber-based armature according to any one of the preceding claims, characterized in that the glue is selected from hot melt glues.

5 7. Fiber-based armature obtained by the process according to any one of claims 1 to 6, adapted to be embedded in at least one matrix.
